I used AI in troubleshooting

- I originally tried running the programs from the wrong folder in VS Code / the terminal, which caused file errors like `NoSuchFileException` for `words.txt` and `movies.txt`. The fix was to `cd` into the correct Problem folder before compiling and running so the program could find the input files.
- I also ran into a VS Code issue where the editor showed `StreamUtil` cannot be resolved even though the code compiled in the terminal. Cleaning the Java language server workspace helped, but compiling/running from the terminal was the most reliable way to confirm everything worked.
- When I changed code and the output did not update, I learned I needed to recompile with `javac` before running again, because java will run the last compiled `.class` file.
- During debugging, I used AI to help identify why the project was not running and how to correctly compile and run multi-file Java programs from the terminal.
